The Commissioner of Patents  
UNITED STATES PATENT OFFICE  
2011 South Clark Place  
Crystal Plaza 2, Room 1B02  
Arlington, Virginia,  
U.S.A. 22202

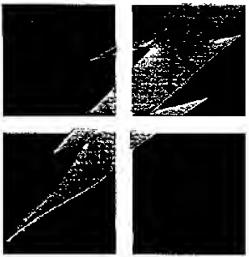

Dear Sir:

Re: Continuation Application Of Pending Prior  
Application Serial No. 08/558,472  
of George Wu, Paul Y. Tam and Ian W. French  
for BIOCOMPATIBLE AQUEOUS SOLUTION FOR USE IN CONTINUOUS  
AMBULATORY PERITONEAL DIALYSIS  
**CUSTOMER NO. 23607**

Please find enclosed herewith the following documentation for filing a continuation application under 37 CFR 1.53(d), of pending prior Application Serial No. 08/558,472 with the Commissioner:

- (a) Utility Patent Application Transmittal;
- (b) Fee Transmittal for FY 2000;
- (c) Copy of Disclosure of United States Patent Application Serial No. 08/558,472 as originally filed;
- (d) Copy of Claims 1-37 of United States Patent Application Serial No. 08/558,472 as originally filed;
- (e) Copy of Verified Statement (Declaration) Claiming Small Entity Status;
- (f) Copy of Declaration, Power of Attorney and Petition;
- (g) Preliminary amendment, including new Claims 38-82;
- (h) New Abstract.

Enclosed along with this material please find a cheque in the amount of **\$609.00 U.S. dollars** which includes \$345.00 for the base filing fee of a small entity, \$39.00 for 1 independent claim over and above the three allowed, and \$225.00 for 25 claims over and above the twenty claims allowed per application. If there is any deficiency or

surplusage of the fees enclosed for filing this Application, please obtain any such deficiency or credit the surplusage to Deposit Account 08-3255 and advise Applicants' Agent.

Also enclosed herewith is a stamped, self-addressed acknowledgment of receipt card which we request that you kindly acknowledge and return to this office at the earliest opportunity.

We thank the Commissioner for his cooperation in this regard and look forward to receiving filing data in this matter.

Respectfully submitted,

Marcelo K. Sarkis

APPLICANT OR PATENTEE : GEORGE WU, PAUL Y. TAM and IAN W. FRENCH  
ATTORNEY'S DOCKET NO. : PT-1143  
SERIAL OR PATENT NO. : 2,155,910  
FILED OR ISSUED : August 11, 1995  
FOR : A BIOCOMPATIBLE AQUEOUS SOLUTION FOR USE IN  
CONTINUOUS AMBULATORY PERITONEAL DIALYSIS

**Verified Statement (Declaration) Claiming Small Entity Status  
(37 CFR 1.9(f) and 1.27(b)) - Independent Inventors**

As below-named inventors, we hereby declare that we qualify as independent inventors as defined in 37 CFR 1.9(c) for purposes of paying reduced fees under Section 41(a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled A BIOCOMPATIBLE AQUEOUS SOLUTION FOR USE IN CONTINUOUS AMBULATORY PERITONEAL DIALYSIS described in

the specification filed herewith;  
 application serial no. , filed ;  
 patent no. , issued .

We have not assigned, granted, conveyed or licensed and are under no obligation under contract or law to assign, grant, convey or license, any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a non-profit organization under 37 CFR 1.9(e).

Each person, concern or organization to which we have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

no such person, concern, or organization  
 persons, concerns or organizations listed below\*

\*NOTE: Separate verified statements are required from each named person, concern or organization having rights to the invention averring to their status as small entities. (37 CFR 1.27)

FULL NAME :  
ADDRESS :  
 INDIVIDUAL  
 SMALL BUSINESS CONCERN  
 NONPROFIT ORGANIZATION

We acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

We hereby declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

**PRELIMINARY AMENDMENT**

June 14, 2000

The Commissioner of Patents  
UNITED STATES PATENT OFFICE  
2011 South Clark Place  
Crystal Plaza 2, Room 1B03  
Arlington, Virginia 22202  
U.S.A.

Dear Sir:

Applicants respectfully request that the following submissions be entered  
as a Preliminary Amendment.

**IN THE ABSTRACT**

Please cancel the abstract presently on file and replace it with the new  
abstract submitted herein.

IN THE DISCLOSURE

The Examiner is requested to amend the specification by inserting before the first line the sentence ---"This application is a continuation of application number 08/558,472, filed November 16, 1995 (status: allowed)."---

At page 1, line 25, after 'by' and before 'Patent', please insert ---US---.

At page 2, line 21, please delete "(Weiczorowska, K. et al Short Reports?)" and insert ---(Wieczorowska, K. et al. Perit. Dial. Int. 15:81, 1995)---.

At page 2, line 29, please delete "glycosoaminoglycans" and insert ---glycosaminoglycans---.

At page 2, lines 32 to 33, after 'peritoneal' please delete "leucocytes" and insert ---leukocytes---.

At page 4, line 16, after 'removal' please delete ";".

At page 5, line 7, please delete "S. marcescens" and insert ---*S. marcescens*---.

At page 5, line 15, please delete "Patent 5, 011,826" and insert ---US Patent 5,011,826---.

At page 5, line 17, after 'whereas' please insert ---US---.

At page 5, line 19, after 'well' please delete "patent" and insert ---US Patent---.

At page 5, lines 25 to 26, after 'solution' please delete "(Kidney Int 46: 496, 1994: US Patent 4,886,789)" and insert ---(Kidney Int. 46: 496, 1994; US Patent 4,886,789)---.

At page 6, line 33, after 'mixture of' please delete "oligimers" and insert --- oligomers---.

At page 6, line 34, after 'each' please delete "oligimer" and insert --- oligomer---.

At page 7, line 23, after '450 mOsm/L' please delete "(from Patent 4,879,280)" and insert ---(from US Patent 4,879,280)---.

At page 8, line 6, after 'Area' please delete "Coefficient" and insert --- Coefficient---.

#### IN THE CLAIMS

Before calculating the fee for filing the instant Continuation Application, please cancel claims 1 to 37 originally filed in United States Patent Application No. 08/558,472 and add new Claims 38 to 82 as follows:

38. A peritoneal dialysis solution comprising at least one amino sugar in an effective amount sufficient to create an osmotic pressure to effect the removal of water by diffusion from the patient's blood across the peritoneal membrane into the solution.

39. The solution of claim 38 wherein the at least one amino sugar is present at a concentration of up to about 5.0% (w/v).

40. The solution of claim 39 wherein the at least one amino sugar is present as a monomer or as an oligomer of 2 to 12 carbohydrate units.

41. The solution of claim 40 wherein the at least one amino sugar is selected from the group consisting of acetylated amino sugars, deacetylated amino sugars and combinations thereof.

42. The solution of claim 41 wherein the acetylated amino sugar is selected from the group consisting of N-acetylglucosamine, N-acetylgalactosamine, N-acetylmannosamine and combinations thereof and the deacetylated amino sugar is selected from the group consisting of glucosamine, galactosamine, mannosamine and combinations thereof.

43. The solution of claim 42 wherein the acetylated amino sugar is N-acetylglucosamine.

44. The solution of claim 43 further comprising at least one electrolyte in an effective amount sufficient to effect the removal of solutes by diffusion from the patient's blood across the peritoneal membrane into the solution.

45. The solution of claim 44 wherein the at least one electrolyte is selected from the group consisting of sodium, calcium, chloride, magnesium, lactate, malate, acetate, succinate, bicarbonate and combinations thereof.

46. The solution of claim 45 further comprising at least one additional agent selected from the group consisting of glucose, iduronic acid, glucuronic acid and combinations thereof.

47. The solution of claim 46 wherein the at least one amino sugar together with the at least one additional agent is present at a concentration of up to about 5.0% (w/v).

48. The solution of claim 47 wherein

- (a) the pH is in the range of about 5.0 to about 7.4;
- (b) the osmolarity is greater than 280 mOsm/L;
- (c) sodium is present at a concentration in the range of about 115 to about 140 mEquiv/L;
- (d) calcium is present at a concentration in the range of about 0.6 to about 5.0 mEquiv/L;
- (e) chloride is present at a concentration in the range of about 100 to about 145 mEquiv/L;
- (f) magnesium is present at a concentration in the range of about 0 to about 2.0 mEquiv/L; and
- (g) lactate, malate, acetate, succinate or bicarbonate is present at a concentration in the range of about 30 to about 45 mEquiv/L.

49. A method of performing peritoneal dialysis comprising the introduction of a peritoneal dialysis solution into the peritoneal cavity of a patient, wherein said peritoneal dialysis solution comprises at least one amino sugar, in an effective amount sufficient to create an osmotic pressure to affect the removal of water by diffusion from the patient's blood across the peritoneal membrane into the solution.

50. The method of claim 49 wherein the at least one amino sugar is present at a concentration of up to about 5.0% (w/v).

51. The method of claim 50 wherein the at least one amino sugar is present as a monomer or as an oligomer of 2 to 12 carbohydrate units.

52. The method of claim 51 wherein the at least one amino sugar is selected from the group consisting of acetylated amino sugars, deacetylated amino sugars and combinations thereof.

53. The method of claim 52 wherein the acetylated amino sugar is selected from the group consisting of N-acetylglucosamine, N-acetylgalactosamine, N-acetylmannosamine and combinations thereof and the deacetylated amino sugar is selected from the group consisting of glucosamine, galactosamine, mannosamine and combinations thereof.

54. The method of claim 53 wherein the acetylated amino sugar is N-acetylglucosamine.

55. The method of claim 54 further comprising at least one electrolyte in an effective amount sufficient to effect the removal of solutes by diffusion from the patient's blood across the peritoneal membrane into the solution.

56. The method of claim 55 wherein the at least one electrolyte is selected from the group consisting of sodium, calcium, chloride, magnesium, lactate, malate, acetate, succinate, bicarbonate and combinations thereof.

57. The method of claim 56 further comprising at least one additional agent selected from the group consisting of glucose, iduronic acid, glucuronic acid and combinations thereof.

58. The method of claim 57 wherein the at least one amino sugar, together with the at least one additional agent is present at a concentration of up to about 5.0% (w/v).

59. The method of claim 58 wherein

- (a) the pH is in the range of about 5.0 to about 7.4;
- (b) the osmolarity is greater than 280 mOsm/L;
- (c) sodium is present at a concentration in the range of about 115 to about 140 mEquiv/L;
- (d) calcium is present at a concentration in the range of about 0.6 to about 5.0 mEquiv/L;
- (e) chloride is present at a concentration in the range of about 100 to about 145 mEquiv/L;
- (f) magnesium is present at a concentration in the range of about 0 to about 2.0 mEquiv/L; and
- (g) lactate, malate, acetate, succinate or bicarbonate is present at a concentration in the range of about 30 to about 45 mEquiv/L.

60. A method of treating a patient suffering from renal failure comprising the introduction of a peritoneal dialysis solution into the peritoneal cavity of a patient, wherein said peritoneal dialysis solution comprises at least one amino sugar in an effective amount sufficient to create an osmotic pressure to affect the removal of water by diffusion from the patient's blood across the peritoneal membrane into the solution.

61. The method of claim 60 wherein the at least one amino sugar is present at a concentration of up to about 5.0% (w/v).

62. The method of claim 61 wherein the at least one amino sugar is present as a monomer or as an oligomer of 2 to 12 carbohydrate units.

63. The method of claim 62 wherein the at least one amino sugar is selected from the group consisting of acetylated amino sugars, deacetylated amino sugars and combinations thereof.

64. The method of claim 63 wherein the acetylated amino sugar is selected from the group consisting of N-acetylglucosamine, N-acetylgalactosamine, N-acetylmannosamine and combinations thereof and the deacetylated amino sugar is selected from the group consisting of glucosamine, galactosamine, mannosamine and combinations thereof.

65. The method of claim 64 wherein the acetylated amino sugar is N-acetylglucosamine.

66. The method of claim 65 further comprising at least one electrolyte in an effective amount sufficient to effect the removal of solutes by diffusion from the patient's blood across the peritoneal membrane into the solution.

67. The method of claim 66 wherein the at least one electrolyte is selected from the group consisting of sodium, calcium, chloride, magnesium, lactate, malate, acetate, succinate, bicarbonate and combinations thereof.

68. The method of claim 67 further comprising at least one additional agent selected from the group consisting of glucose, iduronic acid, glucuronic acid and combinations thereof.

69. The method of claim 68 wherein the at least one amino sugar, together with the at least one additional agent is present at a concentration of up to about 5.0% (w/v).

70. The method of claim 69 wherein

- (a) the pH is in the range of about 5.0 to about 7.4;
- (b) the osmolarity is greater than 280 mOsm/L;
- (c) sodium is present at a concentration in the range of about 115 to about 140 mEquiv/L;

(d) calcium is present at a concentration in the range of about 0.6 to about 5.0 mEquiv/L;

(e) chloride is present at a concentration in the range of about 100 to about 145 mEquiv/L;

(f) magnesium is present at a concentration in the range of about 0 to about 2.0 mEquiv/L; and

(g) lactate, malate, acetate, succinate or bicarbonate is present at a concentration in the range of about 30 to about 45 mEquiv/L.

71. A method of reducing at least one complication associated with peritoneal dialysis, said method comprising the introduction of a peritoneal dialysis solution into the peritoneal cavity of a patient, wherein said peritoneal dialysis solution comprises at least one amino sugar, in an effective amount sufficient to create an osmotic pressure to affect the removal of water by diffusion from the patient's blood across the peritoneal membrane into the solution.

72. The method of claim 71 wherein the at least one complication associated with peritoneal dialysis is selected from the group consisting of:

(i) morphological and functional deterioration of the peritoneal membrane;

(ii) peritonitis;

(iii) adverse metabolic consequences and related cardiovascular disease;

(iv) protein malnutrition

and combinations thereof.

73. The method of claim 72 wherein the at least one amino sugar is present at a concentration of up to about 5.0% (w/v).

74. The method of claim 73 wherein the at least one amino sugar is present as a monomer or as an oligomer of 2 to 12 carbohydrate units.

75. The method of claim 74 wherein the at least one amino sugar is selected from the group consisting of acetylated amino sugars, deacetylated amino sugars and combinations thereof.

76. The method of claim 75 wherein the acetylated amino sugar is selected from the group consisting of N-acetylglucosamine, N-acetylgalactosamine, N-acetylmannosamine and combinations thereof and the deacetylated amino sugar is selected from the group consisting of glucosamine, galactosamine, mannosamine and combinations thereof.

77. The method of claim 76 wherein the acetylated amino sugar is N-acetylglucosamine.

78. The method of claim 77 further comprising at least one electrolyte in an effective amount sufficient to effect the removal of solutes by diffusion from the patient's blood across the peritoneal membrane into the solution.

79. The method of claim 78 wherein the at least one electrolyte is selected from the group consisting of sodium, calcium, chloride, magnesium, lactate, malate, acetate, succinate, bicarbonate and combinations thereof.

80. The method of claim 79 further comprising at least one additional agent selected from the group consisting of glucose, iduronic acid, glucuronic acid and combinations thereof.

81. The method of claim 80 wherein the at least one amino sugar, together with the at least one additional agent is present at a concentration of up to about 5.0% (w/v).

82. The method of claim 81 wherein

- (a) the pH is in the range of about 5.0 to about 7.4;
- (b) the osmolarity is greater than 280 mOsm/L;
- (c) sodium is present at a concentration in the range of about 115 to about 140 mEquiv/L;
- (d) calcium is present at a concentration in the range of about 0.6 to about 5.0 mEquiv/L;
- (e) chloride is present at a concentration in the range of about 100 to about 145 mEquiv/L;
- (f) magnesium is present at a concentration in the range of about 0 to about 2.0 mEquiv/L; and
- (g) lactate, malate, acetate, succinate or bicarbonate is present at a concentration in the range of about 30 to about 45 mEquiv/L.

REMARKS

Claims 38 to 82, as filed herein, are the subject of the instant Continuation Application. Enclosed is a cheque in the amount of \$609.00 U.S. which includes \$345.00 for the base filing fee of a small entity, \$39.00 for 1 independent claim over and above the three allowed, and \$225.00 for 25 claims over and above the twenty claims allowed per application. If there should occur an overpayment or an underpayment of fees in respect of this application, the Commissioner is authorized to access Deposit Account Number 08-3255 to make the appropriate adjustments and advised Applicants' Agent.

If the Examiner has any questions, she is respectfully requested to contact Applicants' Agent, Marcelo K. Sarkis at (905) 771-6414 collect at her convenience.

Respectfully submitted,

5 **TITLE OF INVENTION**

A Biocompatible Aqueous Solution For Use in Continuous Ambulatory Peritoneal Dialysis.

10 **SUMMARY OF THE INVENTION**

Continuous ambulatory peritoneal dialysis (CAPD) is used to treat end stage renal failure (ESRF) by introducing an osmotically active solution into the peritoneal cavity. Toxic waste products and excess fluid move from the blood into the dialysate solution by diffusion and ultrafiltration across the peritoneum. Osmotic ultrafiltration occurs as a result of the addition of hypertonic concentration of glucose to the dialysing solution. Due to the osmotic gradient between the blood and the CAPD solution the glucose draws water from the blood stream into the peritoneal cavity. The osmotic effect is transient and diminishes as the glucose is absorbed and/or metabolised.

In CAPD the dialysis solution is infused from collapsible plastic bags into the peritoneal cavity where it is retained for a period of time (referred to as the dwell time), after which it is drained and discarded. Generally, 3–5 treatments or exchanges of 1–3 litres each of CAPD solution are carried out daily, with an overnight dwell. The glucose concentration varies between 1.5 and 5% (w/v), with commercial CAPD solutions containing 1.5%, 2.5 or 4.5% glucose, with a high lactate content and various electrolytes which are present in more or less pH physiologic concentrations. CAPD patients also lose 5–10 grams of protein into the dialysate per day. Commercial CAPD solutions typically have an osmolarity of 300–700 mOsm/L, preferably 350–450 mOsmol/L, as taught by Patent 5,011,826.

Although peritoneal dialysis has some advantages over hemodialysis, including a substantial cost saving, there are several potential complications to CAPD. These include protein loss through the relatively highly permeable peritoneal membrane, absorption and metabolism of the added glucose resulting in weight gain and hyperlipidemia, which is particularly problematic in diabetic patients, who have a high incidence of ESRF (Ong— Ajyooth, L., Transp Proc 26: 2077, 1994).

An average patient absorbs about 150 grams of glucose from the dialysate per day, which for many patients is an excessive source of carbohydrate and results in hyperinsulinemia and hypertriglyceridemia in non-diabetic patients,

5 which contributes to atherosclerotic disease. This series of events likely contributes to cardiovascular disease which is the most common cause of death among patients with ESRF.

Chronic exposure of the peritoneal membrane to the hypertonic and acidic CAPD solution (pH 5–6.2) can result in a loss of its function as an ultrafiltration membrane, leading to increased permeability of the peritoneal membrane and an increased rate of absorption of glucose from the dialysis solution and a loss of ultrafiltration capability. (Breborowicz et al Advances in Peritoneal Dialysis 8: 11, 1192 and Breborowicz et al Nephron 67: 350, 1994).  
10 Peritoneal biopsy samples from patients chronically dialysed with CAPD solutions show a typical epithelial reaction to irritation, mesothelial cell proliferation, as well as a decrease in the number of microvilli which normally line the mesothelial cell surface (Dobbie, J.W., Lloyd, J.K., Gall, C.A. In R. Khamma, K.D. et al Eds. Advances in peritoneal dialysis. Toronto. U of Toronto Press, 3, 1990; Friedlander, M. J Lab Clin Med 122: 639, 1993). A chronic inflammation of the peritoneum is also a consequence of chronic CAPD treatment, possibly related to the acidic nature of the CAPD solution (Lewis, S. & Holmes, C. Periton Dial Int 11: 14, 1991; Beelen, R.H.J. et al In Maher J.F., Winchester, J.F. Eds. Frontiers in peritoneal dialysis. New York: Field, Richj and Associates, 524, 1986; Bos, H.J. et al Nephron 20 59: 508, 1991), and which leads to healing (Weiczonowska, K. et al Short Reports?). Morphologic changes in the peritoneal structure also occur with chronic CAPD therapy, including fibrosis of the peritoneum (Chaimovitz, C., Kidney Int 45: 1226, 1994). Further, the use of the current relatively acidic and glucose hypertonic CAPD solutions results in a decrease in the function of peritoneal macrophages, 15 again indicating a need for more physiologic and biocompatible CAPD solutions (deFijter, C.W.H. et al Clin Nephrology 39: 75, 1993).

As well, it has been shown that there is a loss of glycosoaminoglycans (GAG's) from the peritoneal membrane which results in a 20 loss of filtration efficiency. It has been suggested that the loss of GAG's from the peritoneal membrane is a result of the increased production of free radicals by activated peritoneal leucocytes (Breborowicz, A. et al Periton Dial Int 11(Suppl): 35a, 1991) or because of a destructive action on interstitial tissue proteins (Fligiel, S.E.G. et al Amer J Pathol 115: 418, 1984). Supplementation of the dialysis fluid 25 with the GAG chondroitin sulphate increases net ultrafiltration due to slower absorption of glucose and fluid from the peritoneal cavity (Advances in Peritoneal Dialysis 8: 11, 1992; Nephron 67: 346, 1994), possibly due to its ability to scavenge free radicals. Other GAG's, such as heparin and dermatan have also been reported 30

5 to scavenge free radicals (Hiebert, L., Liu, J.M., Semin Thromb Hemost 17: 42, 1991; Fracasso, A. et al J Amer Soc Neph 5: 75p, 1994). It has also been reported that hyaluronan (formerly known as hyaluronic acid), which also scavenges free radicals, protects the peritoneum from injury resulting from CAPD treatment (Wieczorowska, K. et al Perit. Dial. Int. 15:81, 1995). Supporting this is the finding  
10 that the dialysis fluid collected overnight has a higher concentration of hyaluronan than serum. For example, Yung, S. et al (Kidney Int 46: 527, 1994) found that hyaluronan levels increased in the dialysate from ESRF patients with or without peritonitis undergoing CAPD treatment, and that the peritoneal mesothelial cells were the likely source of the hyaluronan. Hyaluronan is important in the regulation  
15 of cell proliferation during healing. Hyaluronan is a polymer of repeating molecules of N-acetylglucosamine and glucuronic acid; dermatan is composed of repeating units of N-acetylglucosamine and iduronic acid, and chondroitin is made up of glucuronic acid and N-acetylgalactosamine.

20 Breborowicz and Oreopoulos have submitted a PCT patent application (EP-555087-A1) (priority 92US-830721) for the addition of free radical scavengers such as GAG's, including hyaluronic acid degradation products, to CAPD solutions during episodes of peritonitis to prevent against peritonitis-associated inflammatory reactions .  
25

As noted above, N-acetylglucosamine (NAG) is a component of many GAG's. NAG is formed in almost all cells from glucose through a series of biochemical reactions which include the addition of the amine group from glutamine to glucose to form glucosamine, with N-acetylglucosamine being  
30 synthesized by way of acetyl-CoA. NAG then is converted to NAG-6-phosphate (which is converted into the epimer of NAG, N-acetyl-mannosamine 6-phosphate which is converted to N-acetylneuraminic acid 9-phosphate which is incorporated into sialic acids, gangliosides and glycoproteins ), to NAG-1-phosphate (which is converted into UDP-N-acetylglucosamine (UDP-NAG) which is incorporated into  
35 GAG's such as chondroitins and glycoproteins). The UDP-NAG is also converted into GAG's such as hyaluronan and glycoproteins. Thus, NAG is the primary building block of many essential tissue components, whether they are comprised of NAG itself or related amino sugars such as N-acetylmannosamine and N-acetylgalactosamine.

40 It has been shown that orally administered glucosamine and N-acetylglucosamine (NAG) are absorbed and distributed throughout the body rapidly, and incorporated into tissues and presumably into the GAG's of the body.

5 These compounds are incorporated into the GAG's of the peritoneal membrane to prevent their depletion thus maintaining the integrity of the peritoneal membrane, and preventing or at least slowing down, the loss of membrane function as an ultrafiltration membrane. Thus, the replacement of part or all of the glucose in the presently available CAPD solutions with amino sugars, especially NAG, should  
10 provide a more biocompatible peritoneal dialysis solution, while providing the necessary osmotic effect required for the removal of excess water and also removal of waste substances by solvent drag from patients with ESRF undergoing CAPD treatment. Unlike glucose, which is utilized by almost all microorganisms as a source of energy, the amino sugars are relatively less metabolized and not as likely  
15 to support microbial growth thus reducing the tendency for patients undergoing chronic CAPD treatment to develop peritonitis, a common and serious adverse event associated with CAPD treatment. Because of the rapid removal; of NAG and other amino sugars from the systemic circulation by way of their incorporation into GAG's and various amino sugar containing tissue components the extent of  
20 metabolism into lipids is significantly reduced, thus reducing the risk of obesity, protein malnutrition, dyslipidemia and hypertriglyceridemia, hyperinsulinemia etc and the related adverse metabolic consequences.

In order for NAG and related amino sugars to be useful as osmotic agents in CAPD solutions they must have a high chemical purity similar to that which would be required for use in pharmaceutical products, which means a minimum purity of 98.5%. NAG which is of this purity can be manufactured by two methods. The first is the acid digestion of crude chitin, which is a linear polymer of repeating units of NAG obtained from crab and shrimp shells and other crustaceans, followed by isolation of the deacetylation of the individual NAG units  
30 to glucosamine. The glucosamine is isolated and crystallized to a high level of purity and then is reacetylated using acetic anhydride to N-acetylglucosamine, which is precipitated and recrystallized from alcohol, such that its purity is greater than 98.5%. The second method of manufacturing NAG, and the preferred method,  
35 is to obtain NAG from dried crustacean shell or crude chitin by direct enzymatic digestion with an ensemble of enzymes including chitinase and chitobiase, which degrades the chitin polymer of NAG into disaccharide units of chitobiase and then into monomer units of NAG directly, without having to undergo any organic synthetic step. The NAG is recrystallized from alcohol to a high degree of purity from ethanol. The enzymes required for this process are secreted into the growth  
40 media of various microorganisms, especially *Serratia marcescens*. Thus this method of manufacture not only provides NAG of a suitable purity for use in CAPD solutions but also permits the relatively inexpensive production of NAG as the chitin

5 or crustacean shells can be added directly to the cell-free growth medium from a culture of *S. marcescens* and the NAG readily isolated from the medium after a suitable reaction period. By varying the length of the enzymatic reaction time the production of polymers of varying units of NAG can be produced, which can be further refined and isolated as specific molecular weight entities by way of  
10 separation using available chromatographic techniques, and which can be isolated, crystallized and further purified by recrystallization using methods familiar to those skilled in the methods of carbohydrate chemistry isolation and purification.

15 Patent 5, 011,826 teaches that CAPD solutions can use galactose alone or with glucose in varying ratios as the osmotically active agents, whereas Patent 4,879,280 teaches that disaccharides such as lactose, saccharose, cellobiose etc can be used similarly, both together with suitable electrolyte additives. As well patent 4,879,280 also shows the use of trisaccharides, oligosaccharides and polysaccharides of a molecular weight less than 400,000 such as raffinose, starch, inulin, pectin, dextrans, hydroxy-ethyl starch (HES) and the like. For example, colloidal polymers of glucose of 4–250 glucose units long and with an weight average molecular weight of about 16,200 and a number average molecular weight of 5,800 has been clinically evaluated as component of a CAPD solution (Kidney Int 46: 496, 1994: US Patent 4,886,789). The osmolality of a 7.5% solution of this glucose polymer, called Icodextrin, was 282 mOsm/kg and had a pH of 5.3. However, neither the available scientific literature nor the available patents teach the use of polymers or oligomers of amino sugars such as N-acetylglucosamine, N-acetylmannosamine or N-acetylgalactosamine and the like as the osmotically active components of CAPD solutions, which are the subject  
20  
25  
30 of the present invention.

Since the effectiveness of intraperitoneal dialysis depends on the presence of a hypertonic solution and osmolarity depends on the number of molecules in solution, large molecules such as GAG's provide little of value to the osmotic effect of the CADP solution, and the dialysis solution must still contain excess glucose. Since N-acetylglucosamine and related amino sugars, as well as the other sugar and/or acidic carbohydrates making up the GAG's have molecular weights similar to that of glucose, they would be osmotically active. Therefore, the inclusion of amino sugars, particularly N-acetylglucosamine, in a CAPD solution at concentrations ranging from 0.5 to 5%, with or without the presence of glucose, will provide an effective dialysis solution while being more biocompatible with the peritoneal membrane and thus preventing or slowing down the morphologic and functional deterioration of the peritoneal membrane and extending the time over  
35  
40

5 which ESRF patients may effectively use CAPD treatment. This provides several  
benefits, including substantial cost saving to the health care system by reducing the  
need for expensive hemodialysis, a lower rate of peritoneal infection for patients  
receiving CAPD treatment, a lesser risk of cardiovascular disease due to a  
reduction in the lipid changes typical of use of currently available CAPD solutions,  
10 and a better quality of life for such patients.

Currently marketed CAPD solutions have the following typical  
composition per 100 mL of solution. Dextrose anhydrous 1.5, 2.5 or 4.25 plus  
15 Sodium Chloride 567 mg, Sodium lactate 392 mg, Calcium Chloride dihydrate  
23.9 mg and Magnesium Chloride hexahydrate 15.2 mg. On a milliequivalence  
basis this represents 132 mEq Na/L, 3.24 mEq Ca/L, 1.5 mEq Mg/L, 101.75 mEq  
Cl/L and 36 mEq lactate/L. Alternately, the solution may contain malate, acetate or  
succinate in place of lactate. The solution typically has an osmotic pressure of 347  
mOsmol/L.

20 The CAPD solution of this invention is intended to provide similar  
electrolyte levels as currently available CAPD solutions, except that the osmotically  
active carbohydrate composition is different, being composed of acetylated and  
deacetylated amino sugars including N-acetylglucosamine, glucosamine,  
25 N-acetylgalactosamine, galactosamine, N-acetylmannosamine, mannosamine  
each alone, or in combination at varying concentrations or with varying  
concentrations of glucose, or oligomers of N-acetylglucosamine,  
N-acetylmannosamine, N-galactosamine, galactosamine, mannosamine, and  
30 glucosamine such that they are comprised of at least 2 carbohydrate units and not  
more than 12 units. The composition may be a mixture of oligimers of varying  
amounts of each oligimer either alone or in combination with each other. As well  
the CAPD solutions of this patent may contain additional osmotically active agents  
in varying proportions to the acetylated and deacetylated amino sugars such acidic  
35 carbohydrates which are also incorporated into the tissue glycosoaminoglycans  
(GAG's) such as glucuronic acid and iduronic acid.

In animal models of inflammatory bowel disease the colon becomes  
fibrotic, as does the peritoneum as a result of chronic intraperitoneal dialysis. The  
administration of a solution of NAG into the bowel of rats in which a chemically  
40 induced inflammatory bowel reaction with bowel wall thickening or fibrosis occurs,  
reduces in a dose dependent manner the fibrotic reaction to the inflammatory  
stimulus (Table 1). It is to be expected that in a similar manner NAG will prevent the  
development of fibrosis of the peritoneum in CAPD patients.

5

In addition to glucose CAPD solutions typically also contain a suitable number and quantity of electrolytes such that a more less physiologic solution is obtained. For example, lactate is included as a base substitute. Its absorption and metabolism will correct metabolic acidosis. Sodium is usually included at a concentration slightly lower to that found in plasma, or 132–137 mM/L, to promote sodium removal. Similarly, chloride is usually included in the CAPD solution at physiologic strengths of 100–110 mM/L.

The normal osmolarity of blood is approximately 280 mOsm/L, so that a CAPD solution must have a greater osmotic value than this if it to be effective as a dialysis solution, and preferably it should have an osmotic pressure of 300–700 mOsm/L, and more specifically 310–560, or in a more limited range, of 350 to 450 mOsm/L (from Patent 4,879,280).

In experiments in which rats were dialyzed for 4 hours with Hanks Balances salt solution with either glucose or N-acetylglucosamine added at a concentration of 75 mM or 214 mM, at a pH of 7.35 – 7.4. The net ultrafiltration was calculated as the difference between the drained volume of dialysate after 4 hours dwell time in the peritoneal cavity and the infused volume (20 mL) of the dialysis fluid. As well, the concentration of urea and creatinine in the blood and the dialysis fluid were measured. Permeability of the peritoneal membrane to urea and creatinine, expressed as the Mass Transfer Area Coefficient which was calculated according to the method of Krediet et al (Blood Purif 4: 194, 1986). The results, given in the Table below, clearly demonstrate that NAG results in a statistically significant increase in net ultrafiltration as well as peritoneal clearance of urea without increasing albumin or total protein loss into the dialysis fluid. In

5 addition, the inclusion of NAG in the dialysate fluid stimulated the synthesis of hyaluronic acid, as shown by the more than 100% increase in amount of hyaluronic acid secreted in the dialysis fluid compared to the glucose treated rats. These in vivo experiments clearly demonstrate that NAG is a more effective osmotic agent than glucose when used for peritoneal dialysis.

20

As many changes can be made to the embodiments of the invention without departing from the scope of the invention, it is intended that all material herein be interpreted as illustrative of the invention and not in a limiting sense.

THE EMBODIMENTS OF THE INVENTION IN WHICH AN EXCLUSIVE PROPERTY OR PRIVILEGE IS CLAIMED ARE DEFINED AS FOLLOWS:

1. A peritoneal dialysis solution which comprises a water solution with a pH compatible with the intended use of the product, with electrolytes, including sodium, chloride, calcium and magnesium of a suitable and compatible compositions and one or a combination of acetylated or deacetylated amino sugars, such as glucosamine, N-acetylglucosamine, galactosamine, N-acetylgalactosamine, mannosamine, N-acetylmannosamine as monomers or oligomers of 2 to 12 carbohydrate units alone or in combination with glucose and/or sodium lactate, malate, acetate, succinate and/or iduronic acid and/or glucuronic acid.
2. The solution of claim 1 in which the pH is in the range of 5 – 7.4 and the sodium concentration is present in the range of 115 – 140 mEquiv/L, calcium is present in the range of 0.6 mEquiv/L, chloride is present in the range of 100 – 145 mEquiv/L, magnesium is present in the range of 0 – 2 mEquiv/L, lactate, malate, acetate or succinate in the range of 30 – 45 mEquiv/L.
3. The solution of claim 1 in which the osmotically active agent is an amino sugar taken from the following group of compounds of glucosamine, N-acetylglucosamine, galactosamine, N-acetylgalactosamine, mannosamine or N-acetylmannosamine.
4. The solution of claim 3 in which the osmotically active agents are present at a concentration of 0.5 – 5.0 % (w/v).
5. The solution of claim 3 of which the osmotically active agents are present at the concentrations specified in claim 4 together with glucose at a concentration of 0.5 to 5.0% (w/v).
6. The solution of claim 1 in which the osmotically active agents are present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.
7. A peritoneal dialysis solution comprising an effective amount of an acetylate or deacetylated amino sugar and/or combinations thereof.

8. The peritoneal dialysis solution of claim 7 wherein the amino sugar is N-acetylglucosamine (NAG).
9. The peritoneal dialysis solution of claim 7 wherein the amino sugar is selected from glucosamine, N-acetylglucosamine, galactosamine, N-acetylgalactosamine, mannosamine, N-acetylmannosamine as monomers or oligomers of 2 to 12 carbohydrate units alone or in combination with glucose and/or sodium lactate, malate, acetate, succinate and/or iduronic acid and/or glucuronic acid.
10. The solution of claim 7 in which the pH is in the range of 5 – 7.4 and the sodium concentration is present in the range of 115 – 140 mEquiv/L, calcium is present in the range of 0.6 mEquiv/L, chloride is present in the range of 100 – 145 mEquiv/L, magnesium is present in the range of 0 – 2 mEquiv/L, lactate, malate, acetate or succinate in the range of 30 – 45 mEquiv/L.
11. The solution of claim 8 in which the pH is in the range of 5 – 7.4 and the sodium concentration is present in the range of 115 – 140 mEquiv/L, calcium is present in the range of 0.6 mEquiv/L, chloride is present in the range of 100 – 145 mEquiv/L, magnesium is present in the range of 0 – 2 mEquiv/L, lactate, malate, acetate or succinate in the range of 30 – 45 mEquiv/L.
12. The solution of claim 9 in which the pH is in the range of 5 – 7.4 and the sodium concentration is present in the range of 115 – 140 mEquiv/L, calcium is present in the range of 0.6 mEquiv/L, chloride is present in the range of 100 – 145 mEquiv/L, magnesium is present in the range of 0 – 2 mEquiv/L, lactate, malate, acetate or succinate in the range of 30 – 45 mEquiv/L.
13. The solution of claim 7 in which the amino sugar is taken from the following group of compounds of glucosamine, N-acetylglucosamine, galactosamine, N-acetylgalactosamine, mannosamine or N-acetylmannosamine.
14. The solution of claim 9 in which the amino sugar is taken from the following group of compounds of glucosamine, N-acetylglucosamine, galactosamine, N-acetylgalactosamine, mannosamine or N-acetylmannosamine.
15. The solution of claim 7 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).

16. The solution of claim 8 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
17. The solution of claim 9 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
18. The solution of claim 10 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
19. The solution of claim 11 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
20. The solution of claim 12 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
21. The solution of claim 13 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
22. The solution of claim 14 in which the amino sugar is present at a concentration of 0.5 – 5.0 % (w/v).
23. The solution of claim 7 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.
24. The solution of claim 9 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.
25. The solution of claim 10 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

26. The solution of claim 11 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

27. The solution of claim 12 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

28. The solution of claim 13 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

29. The solution of claim 14 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

30. The solution of claim 15 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

31. The solution of claim 16 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

32. The solution of claim 17 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

33. The solution of claim 18 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars

comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

34. The solution of claim 19 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

35. The solution of claim 20 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

36. The solution of claim 21 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

37. The solution of claim 22 in which the amino sugar is present as monomers of the amino sugars specified or are oligomers of these amino sugars comprising 2 – 12 carbohydrate units, alone or together with glucose as detailed in claim 5.

## **ABSTRACT**

The present invention relates to a peritoneal dialysis solution comprising at least one amino sugar in an effective amount sufficient to create an osmotic pressure to effect the removal of water by diffusion from the patient's blood across the peritoneal membrane into the solution. In one embodiment the at least one amino sugar is selected from the group consisting of acetylated amino sugars, preferably N-acetylglucosamine, deacetylated amino sugars and combinations thereof.

# **Declaration, Power Of Attorney And Petition**

We, **GEORGE WU, PAUL Y. TAM and IAN W. FRENCH**, declare that we are citizens of CANADA residing at c/o #3 Gerald Street, Willowdale, Ontario, Canada, M2L 2M4; that we have reviewed and understood the contents of the attached Specification, including the Claims as amended by any amendments referred to and we verily believe we are the original, first and joint inventors of the invention **A BIOCOMPATIBLE AQUEOUS SOLUTION FOR USE IN CONTINUOUS AMBULATORY PERITONEAL DIALYSIS** described and claimed in the attached specification; that we do not know and do not believe that this invention was ever known or used in the United States of America before our invention or discovery thereof, or patented or described in any printed publication in any country before our invention or discovery thereof, or more than one year prior to this application; that this invention was not in public use or on sale in the United States of America for more than one year prior to this application; that this invention or discovery has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by us or our legal representatives or assigns more than twelve (12) months before this application; that we acknowledge our duty to disclose information of which we are aware which is material to the examination of this application in accordance with 37 CFR 1.56(a), and that no application for patent or inventor's certificate on this invention or discovery has been filed by us or our representatives or assigns in any country foreign to the United States of America except as follows:

Canadian Patent Application Serial No. 2,155,910 filed on August 11, 1995 from which application convention priority is claimed

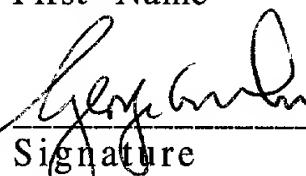

And I hereby appoint **IVOR M. HUGHES, NEIL H. HUGHES, and MARCELO K. SARKIS**, carrying on business at 175 Commerce Valley Drive West, Suite 200, Thornhill, Ontario, L3T 7P6, Canada, Registration Number 27,759, Registration Number 33,636, and Registration Number 37,015, as my attorney or agent to prosecute this application and to transact all business in the Patent Office connected therewith.

Wherefore we pray that Letters Patent be granted to us for the invention or discovery described and claimed in the foregoing specification and claims, and we hereby subscribe our names to the foregoing specification and claims, declaration, power of attorney, and this petition.

We declare further that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issuing thereon.
